## PIPERAZINE AND PIPERIDINE DERIVATIVES FOR TREATMENT OR PREVENTION OF NEURONAL DAMAGE

TECHNICAL FIELD OF THE INVENTION

The present invention relates to piperazine and piperidine derivatives, which are especially useful for treating or preventing neuronal damage, particularly damage associated with neurological diseases. These compounds are also useful for stimulating nerve growth. The invention also provides compositions comprising the compounds of the present invention and methods of utilizing those compositions for treating or preventing neuronal damage or for stimulating nerve growth.

BACKGROUND OF THE INVENTION

Neurological diseases are associated with the death of or injury to neuronal cells. Typical treatment of neurological diseases involves drugs capable of inhibiting neuronal cell death. A more recent approach involves the promotion of nerve regeneration by promoting neuronal growth.

Neuronal growth, which is critical for the survival of neurons, is stimulated in vitro by nerve growth factors (NGF). For example, Glial Cell Line-Derived Neurotrophic Factor (GDNF) demonstrates neurotrophic activity both, in vivo and in vitro, and is currently being investigated for the treatment of Parkinson's disease. Insulin and insulin-like growth factors have been shown to stimulate growth of neurites in rat pheochromocytoma PC12 cells and in cultured sympathetic and sensory neurons [Recio-Pinto et al., J. Neurosci., 6, pp. 1211-1219 (1986)]. Insulin and

-2-

insulin-like growth factors also stimulate the regeneration of injured motor nerves *in vivo* and *in vitro* [Near et al., Proc. Natl. Acad. Sci., pp. 89, 11716-11720 (1992); and Edbladh et al., Brain Res., 641, pp. 76-82 (1994)]. Similarly, fibroblast growth factor (FGF) stimulates neural proliferation [D. Gospodarowicz et al., Cell Differ., 19, p. 1 (1986)] and growth [M. A. Walter et al., Lymphokine Cytokine Res., 12, p. 135 (1993)].

There are, however, several disadvantages associated with the use of nerve growth factors for treating neurological diseases. They do not readily cross the blood-brain barrier. They are unstable in plasma and they have poor drug delivery properties.

Recently, small molecules have been shown to stimulate neurite outgrowth *in vivo*. In individuals suffering from a neurological disease, this stimulation of neuronal growth protects neurons from further degeneration, and accelerates the regeneration of nerve cells. For example, estrogen has been shown to promote the growth of axons and dendrites, which are neurites sent out by nerve cells to communicate with each other in a developing or injured adult brain [(C. Dominique Toran-Allerand et al., J. Steroid Biochem. Mol. Biol., 56, pp. 169-78 (1996); and B. S. McEwen et al., Brain Res. Dev. Brain. Res., 87, pp. 91-95 (1995)]. The progress of Alzheimer's disease is slowed in women who take estrogen. Estrogen is hypothesized to complement NGF and other neurotrophins and thereby help neurons differentiate and survive.

Other target sites for the treatment of neurodegenerative disease are the immunophilin class of proteins. Immunophilins are a family of soluble proteins

-3-

that mediate the actions of immunosuppressant drugs such as cyclosporin A, FK506 and rapamycin. Of particular interest is the 12 kDa immunophilin, FK-506 binding protein (FKBP12). FKBP12 binds FK-506 and rapamycin, leading to an inhibition of T-cell activation and proliferation. Interestingly, the mechanism of action of FK-506 and rapamycin are different. For a review, see, S. H. Solomon et al., Nature Med., 1, pp. 32-37 (1995). It has been reported that compounds with an affinity for FKBP12 that inhibit that protein's rotomase activity possess nerve growth stimulatory activity. [Lyons et al., Proc. Natl. Acad. Sci. USA, 91, pp. 3191-3195 (1994)]. Many of these such compounds also have immunosuppressive activity.

FK506 (Tacrolimus) has been demonstrated to act synergistically with NGF in stimulating neurite outgrowth in PC12 cells as well as sensory ganglia [Lyons et al. (1994)]. This compound has also been shown to be neuroprotective in focal cerebral ischemia [J. Sharkey and S. P. Butcher, Nature, 371, pp. 336-339 (1994)] and to increase the rate of axonal regeneration in injured sciatic nerves [B. Gold et al., J. Neurosci., 15, pp. 7509-16 (1995)].

The use of immunosuppressive compounds, however, has drawbacks in that prolonged treatment with these compounds can cause nephrotoxicity [Kopp et al., J. Am. Soc. Nephrol., 1, p. 162 (1991)], neurological deficits [P.C. DeGroen et al., N. Eng. J. Med., 317, p. 861 (1987)] and vascular hypertension [Kahan et al., N. Eng. J. Med., 321, p. 1725 (1989)].

Sub-classes of FKBP binding compounds which inhibit rotomase activity, but which purportedly lack

-4-

immunosuppressive function have been disclosed for use in stimulating nerve growth and for neuroprotection [see, United States patent 5,614,547; WO 96/40633; WO 96/40140; WO 97/16190; WO 98/13343; WO 98/13355; WO 98/29116; WO 98/29117; WO 98/35675; WO 98/37882; WO 98/37885; J. P. Steiner et al., Proc. Natl. Acad. Sci. USA, 94, pp. 2019-23 (1997); and G. S. Hamilton et al., Bioorg. Med. Chem. Lett., 7, pp. 1785-90 (1997)].

Stimulation of neural axons in nerve cells by piperidine derivatives is described in WO 96/41609. Clinical use of the piperidine and pyrrolidine derivatives known so far for stimulating axonal growth has not been promising, as the compounds are unstable in plasma and do not pass the blood-brain barrier in adequate amounts.

More recently, classes of compounds which lack the ability to bind FKBP and lack immunosuppressive function have been described for use in stimulating nerve growth and preventing neurodegeneration [see, WO 98/20891; WO 98/20892; WO 98/20893 and WO 99/10340

Though a wide variety of compounds for treating or preventing neurological degenerative diseases have been described, only two of these are currently in clinical trials and none have been approved for commercialization. And while compounds which share certain structural similarities to the compounds disclosed herein have been described in United States patent Nos. 4,115,569 and 4,374,990, neither of those patents specifically teach or suggest the compounds of the present invention, nor is there any teaching that such compounds would have utility in stimulating nerve growth or preventing neurodegeneration.

-5-

Thus, there remains a need for the discovery and design of new compounds and compositions that have the ability to prevent and/or treat neuronal damage associated with neuropathologic conditions.

-12-

wherein two carbon ring atoms in the depicted ring structure may be linked to one another via a C<sub>1</sub>-C<sub>4</sub> straight alkyl or a C<sub>2</sub>-C<sub>4</sub> straight alkenyl to create a bicyclic moiety.

5                   The term "ring atom", as used herein, refers to a backbone atom that makes up the ring. Such ring atoms are selected from C, N, O or S and are bound to 2 or 3 other such ring atoms (3 in the case of certain ring atoms in a bicyclic ring system). The term "ring atom" does not include hydrogen.

10                   It will be readily apparent to those of skill in the art that the terms "alkyl" and "alkenyl" when used in the definition of Y represent those portions of an aliphatic moiety for which proper valence is completed by the moieties bound to Y (i.e., at one end, the ring atom to which Y is bound; and at the other end, A and B). Thus, as an example, for the purposes of this invention, Y is considered a C<sub>2</sub> alkyl in each of the following structures (the moiety representing Y being shown in bold):

20                   The above compounds specifically exclude those compounds in which Q is an indole or a pyroglutamic moiety. Such compounds are known in the art and are not within the scope of the compounds of the present invention. 25 straight or branched alkenyl, or (C<sub>3</sub>-C<sub>6</sub>)-straight or branched alkenyl-Ar. In yet another preferred embodiment, p is 0 or 1; and X is C or N.

In another preferred embodiment of the compound  
5 of formula (I), Y is a bond, -O-, -CH<, or =CH<.

According to another preferred embodiment, one of A or B is absent or selected from hydrogen, phenyl, chlorophenyl, dichlorophenyl, fluorophenyl, or difluorophenyl and the other of A or B is selected from phenyl, chlorophenyl, dichlorophenyl, fluorophenyl, or difluorophenyl.

One of skill in the art will be well aware of analogous synthetic methods for preparing compounds of formula (I).

The nerve growth stimulatory activity of the compounds of this invention may be initially assayed using several cell culture assays known in the art. For example, the compounds of this invention may be tested in a neurite outgrowth assay using pheochromocytoma PC12 cells as described by Lyons et al., PNAS, 91, pp. 3191-3195 (1994). A similar assay may be carried out in SH-SY5Y human neuroblastoma cells. Alternatively, the chick dorsal root ganglia assay described in United States patent 5,614,547 or in G. S. Hamilton et al., Bioorg. Med. Chem. Lett., (1997) and references cited therein, may be utilized.

The compounds of this invention may also be assayed for nerve growth stimulatory activity in vivo using a mouse model of Parkinson's disease [J. P. Steiner et al., Proc. Natl. Acad. Sci. USA, 94, pp. 2019-23 (1997), United States patent 5,721,256] or following surgical sciatic nerve crush in rats.

The neuroprotective activity of the compounds of this invention may be assayed using rat embryo ventral mesencephalic cells in culture which are subsequently exposed to the glutamate receptor agonist NMDA. This assay is described in detail in the example section.

5           As used herein, the described compounds used in the pharmaceutical compositions and methods of this invention, are defined to include pharmaceutically acceptable derivatives thereof. A "pharmaceutically acceptable derivative" denotes any pharmaceutically  
10 acceptable salt, ester, or salt of such ester, of a compound of this invention or any other compound which, upon administration to a patient, is capable of providing (directly or indirectly) a compound of this invention, or a metabolite or residue thereof, characterized by the  
15 ability to promote repair or prevent damage of neurons from disease or physical trauma.

20 which increase biological penetration into a given biological system (e.g., blood, lymphatic system, central nervous system), increase oral availability, increase solubility to allow administration by injection, alter metabolism and alter rate of excretion.

25 The compositions of the present invention may be administered orally, parenterally, by inhalation spray, topically, rectally, nasally, buccally, vaginally or via an implanted reservoir. The term "parenteral" as used herein includes subcutaneous, intravenous,  
30 intramuscular, intra-articular, intra-synovial, intrasternal, intrathecal, intrahepatic, intralesional and intracranial injection or infusion techniques.

-25-

Preferably, the compositions are administered orally, intraperitoneally or intravenously.

Sterile injectable forms of the compositions of this invention may be aqueous or oleaginous suspension.

5 These suspensions may be formulated according to techniques known in the art using suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally  
10 acceptable diluent or solvent, for example as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed  
15 as a solvent or suspending medium. For this purpose, any bland fixed oil may be employed including synthetic mono- or di-glycerides. Fatty acids, such as oleic acid and its glyceride derivatives are useful in the preparation of injectables, as are natural  
20 pharmaceutically-acceptable oils, such as olive oil or castor oil, especially in their polyoxyethylated versions. These oil solutions or suspensions may also contain a long-chain alcohol diluent or dispersant, such as Ph. Helv or similar alcohol.

25 The pharmaceutical compositions of this invention may be orally administered in any orally acceptable dosage form including, but not limited to, capsules, tablets, aqueous suspensions or solutions. In the case of tablets for oral use, carriers which are  
30 commonly used include lactose and corn starch.

Lubricating agents, such as magnesium stearate, are also typically added. For oral administration in a capsule

-26-

form, useful diluents include lactose and dried corn starch. When aqueous suspensions are required for oral use, the active ingredient is combined with emulsifying and suspending agents. If desired, certain sweetening, 5 flavoring or coloring agents may also be added.

Alternatively, the pharmaceutical compositions of this invention may be administered in the form of suppositories for rectal administration. These can be prepared by mixing the agent with a suitable 10 non-irritating excipient which is solid at room temperature but liquid at rectal temperature and therefore will melt in the rectum to release the drug. Such materials include cocoa butter, beeswax and polyethylene glycols.

15 The pharmaceutical compositions of this invention may also be administered topically, especially when the target of treatment includes areas or organs readily accessible by topical application, including diseases of the eye, the skin, or the lower intestinal 20 tract. Suitable topical formulations are readily prepared for each of these areas or organs.

Topical application for the lower intestinal tract can be effected in a rectal suppository formulation (see above) or in a suitable enema formulation. 25 Topically-transdermal patches may also be used.

Carriers for topical 30 administration of the compounds of this invention include, but are not limited to, mineral oil, liquid petrolatum, white petrolatum, propylene glycol,

-27-

polyoxyethylene, polyoxypropylene compound, emulsifying wax and water. Alternatively, the pharmaceutical compositions can be formulated in a suitable lotion or cream containing the active components suspended or dissolved in one or more pharmaceutically acceptable carriers. Suitable carriers include, but are not limited to, mineral oil, sorbitan monostearate, polysorbate 60, cetyl esters wax, cetearyl alcohol, 2-octyldodecanol, benzyl alcohol and water.

For ophthalmic use, the pharmaceutical compositions may be formulated as micronized suspensions in isotonic, pH adjusted sterile saline, or, preferably, as solutions in isotonic, pH adjusted sterile saline, either with or without a preservative such as benzylalkonium chloride. Alternatively, for ophthalmic uses, the pharmaceutical compositions may be formulated in an ointment such as petrolatum.

The pharmaceutical compositions of this invention may also be administered by nasal aerosol or inhalation. Such compositions are prepared according to techniques well-known in the art of pharmaceutical formulation and may be prepared as solutions in saline, employing benzyl alcohol or other suitable preservatives, absorption promoters to enhance bioavailability, fluorocarbons, and/or other conventional solubilizing or dispersing agents.

The amount of both a described compound and the optional neurotrophic factor that may be combined with the carrier materials to produce a single dosage form will vary depending upon the host treated and the particular mode of administration. Preferably, the compositions should be formulated so that a dosage of

-28-

between 0.01 - 100 mg/kg body weight/day of the described compound can be administered. If a neurotrophic factor is present in the composition, then a dosage of between 0.01 µg - 100 mg/kg body weight/day of the neurotrophic factor can be administered to a patient receiving these compositions.

It should also be understood that a specific dosage and treatment regimen for any particular patient will depend upon a variety of factors, including the activity of the specific compound employed, the age, body weight, general health, sex, diet, time of administration, rate of excretion, drug combination, and the judgment of the treating physician and the severity of the particular disease being treated. The amount of active ingredients will also depend upon the particular described compound and neurotrophic factor in the composition.

According to another embodiment, this invention provides methods for promoting repair or preventing neuronal damage *in vivo* or in an *ex vivo* nerve cell. Such methods comprise the step of treating nerve cells, glial cells, chromafin cells or stem cells with any of the compounds described above. Preferably, this method promotes repair or prevents neuronal damage in a patient, and the compound is formulated into a composition additionally comprising a pharmaceutically acceptable carrier. The amount of the compound utilized in these methods is between about 0.01 and 100 mg/kg body weight/day.

According to an alternate embodiment, the method of promoting repair or preventing neuronal damage comprises the additional step of treating nerve cells

-29-

##### Combinatorial Synthesis of Compounds Via Scheme 7

Compounds of this invention were also made via the synthetic scheme set forth in Scheme 7. The coupling

-80-

of the appropriate Boc-Amino Acid (150  $\mu$ mol) with amines (300  $\mu$ mole) was accomplished using N-cyclohexanecarbodiimide-N'-propyloxymethyl polystyrene resin (300  $\mu$ mol) as described in Example 12. The

5 resulting Boc-protected amino amides were treated with a saturated solution of HCl in ethyl acetate (5 mL). After shaking for 3 hours, filtration and evaporation afforded the pure products as hydrogen chloride salts.

The above products were taken up in methanol (1

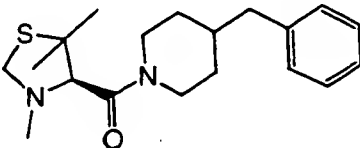

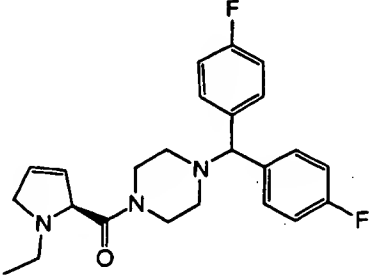

10 mL) and transferred to the reaction block wells containing  $K_2CO_3$  (excess) suspended in  $CH_3CN$  (5 mL). The reactions were treated with the appropriate alkyl halide (300  $\mu$ mol) and the reaction block was shaken for 24 hours at ambient temperature or at 50°C, depending upon the

15 alkyl halide. Filtration and evaporation gave the crude compounds. Purification was performed using reverse phase HPLC ( $H_2O/CH_3CN/0.1\%$  TFA) to afford the desired products as determined by LC/MS.

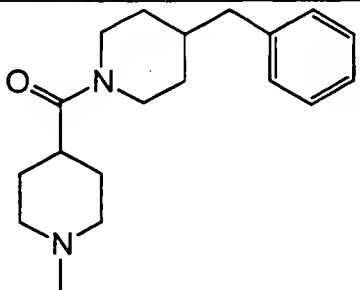

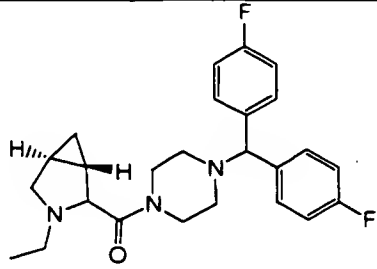

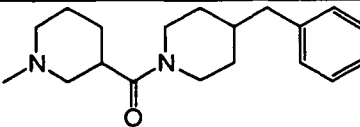

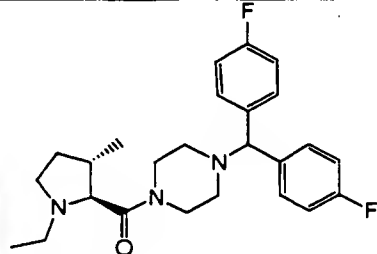

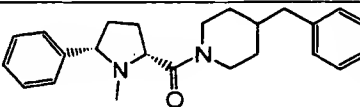

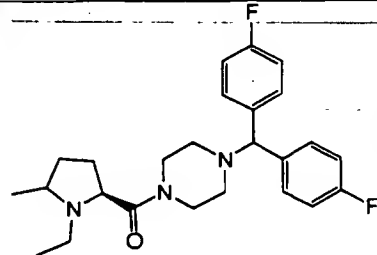

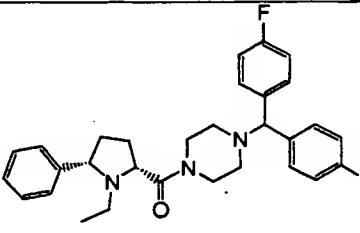

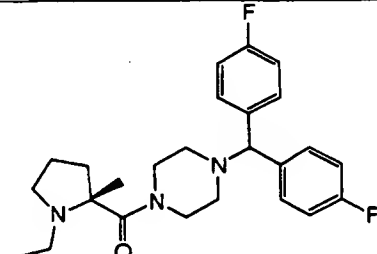

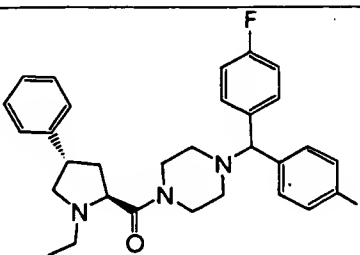

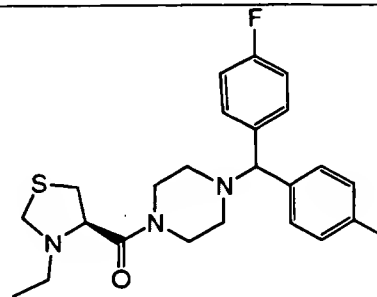

Table 2 sets forth compounds that were prepared

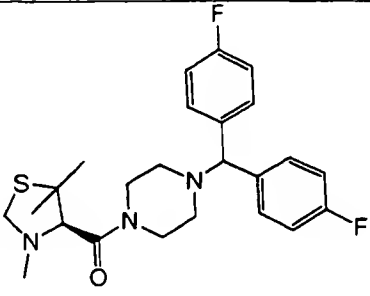

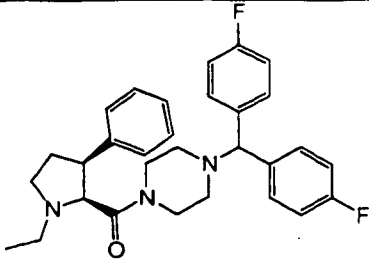

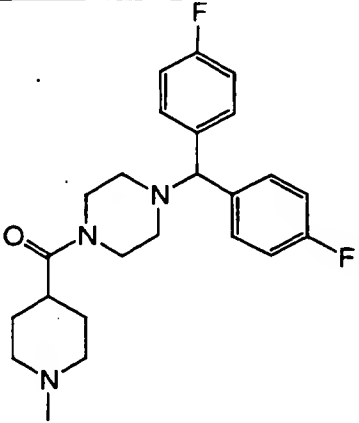

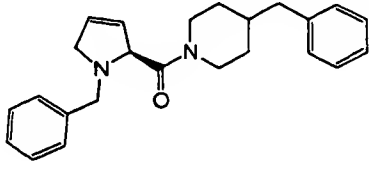

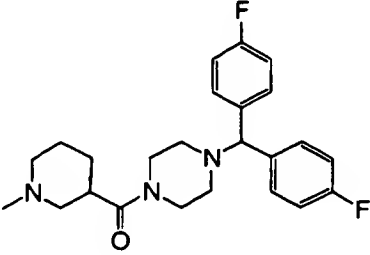

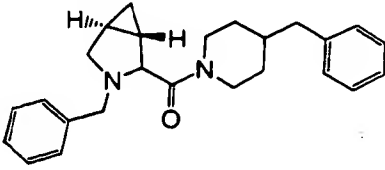

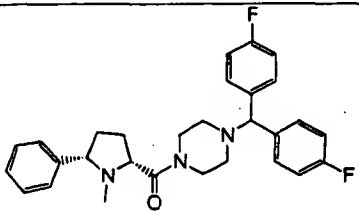

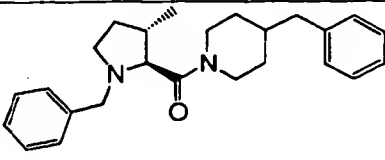

20 by this method or via Scheme 3 (see Example 11) and their mass spectrometry values.

Example 66Neuroprotection Assay

The ventral mesencephalic region was dissected out of embryonic day 15 Sprague-Dawley rat embryos (Harlan), dissociated into single cell suspension by a combination of trypsinization and trituration (Costantini et al., Neurobiol Dis., pp. 97-106 (1998). Dissociated VM cells were plated into poly-L-ornithine-coated 96-well plates at a density of 85,000 cells/well in 100  $\mu$ L of DMEM supplemented with 18% heat-inactivated horse serum, 0.24% glucose, 2 mM glutamine and 50 u/ml penicillin/streptomycin and incubated in a 5% CO<sub>2</sub> incubator. After one day in culture (DIV1), the medium was replaced with 100  $\mu$ L of a defined medium (DMEM supplemented with 1x N2 cocktail (Gibco-BRL), 0.12% glucose, 2 mM glutamine, and 50 units/ml penicillin/streptomycin) containing DMSO or various concentrations of the compounds of this invention. On DIV5, neuroexcitotoxic injury was induced by the addition of various concentrations of the glutamate receptor agonist NMDA (100-400  $\mu$ M). Cultures were incubated with the neurotoxin for 20 hours and the effects of neurophilin compounds were assessed using high affinity <sup>3</sup>H-dopamine uptake according to a procedure published by Park and Mytilineou [Brain Res., 599, pp.

83-97 (1992)] .

4-Fluorobenzyl triphenylphosphonium chloride  
10 (54.2g, 133.2 mmol) was suspended in 400 ml of anhydrous THF. Sodium hydride (60% dispersion in mineral oil; 5.35g, 133.2 mmol) was added to the suspension and stirred at room temperature for 3 hours. A solution of  
tert-butyl 4-oxo-1-piperidinecarboxylate (25 g, 125.5  
15 mmol) in 150 ml of anhydrous THF was added dropwise over 1 hour. The reaction was heated to reflux for 8 hours and then cooled to room temperature, filtered, and the filtrate evaporated in vacuo to afford the crude product as a yellow viscous oil. The crude product was purified  
20 by flash chromatography (SiO<sub>2</sub>) eluted with a gradient of hexane to hexane-ethyl acetate (7:3). The pure fractions were combined and evaporated to afford 25.83 g (70% yield) of Compound 82 as a white crystalline solid.

Continuation of Box I.2

Claims Nos.: 1-9 (partially), 11-24 (partially)

Present claims 1-9 (partially) and 11-24 (partially) relate to an extremely large number of possible compounds. Support within the meaning of Article 6 PCT and/or disclosure within the meaning of Article 5 PCT is to be found, however, for only a very small proportion of the compounds claimed. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible. Consequently, the search has been carried out for those parts of the claims which appear to be supported and disclosed, namely the compounds actually exemplified in the description.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
